"Purification and some properties of two enzymes from a beta-glucanase hyperproducing strain, Bacillus subtilis HL-25.";
AGRIC. BIOL. CHEM. 53.2341-3346(1989).
-! CATALYTIC ACTIVITY: HYDROLYSIS OF 1,4 BETA-D-GLYCOSIDIC LINKAGES
-! BETA-D-GLUCANS CONTAINING 1,3 - AND 1,4 -BONDS.
-! BETA-GLUCANASES OF BACILUS HAVE A SUBSTRATE RANGE SIMILAR TO LICHENASE OF GERMINATING BARLEY.
-! THE SEQUENCE OF STRAIN 168 1S SHOWN.
-! SUBCELLULAR LOCATION: SECREFEED.
-! SUBCELLULAR LOCATION: SECREFEED.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         3; Gaps

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Production of Haemophilus influenzae HibP2 protein - for the prevention of bacterial meningitis in animals Claim 15; Figure 7; 63pp; English.

To clone P2 into expression vector pET-11a (Novagen pET System Manual) a 1.kb fragment from full length P2 (in pNV-1) (see Q84354) was generated using PCR and oligos Q85350 and Q84353.
Oligo Q85350 anilowed the mature P2 protein to be cloned into the Nder site of pET 11a. Q84353 incorporated a BamHI site. The P2 fragment thus generated was digested with NdeI and BamHI, purified and ligated into pET11a previously cut with NdeI-BamHI. This resulted in mature P2 construct - pNV-6. The rest of the plasmid is Sequence 342 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        R66880;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gene coding for protein P2 of Haemophilus influenzae type-B used for developing vaccines for protection against disease caused by the organism.

Claim 1: Page 8: 15pp: English.

Peptide may be used as a vaccine to the disease caused by H1 type b, as carrier for conjugation to oligosaccharide derived from Haemophilus. Protein may be used with other haptens as Sequence 341 AA;
                                                                                                                                                                                                                                                       04-DEC-1990 (first entry)

Table 11; Page 59; 99pp; English.
The sequences given in R40053-101 are peptide fragments derived from the sequences given in R40053-101 are peptide fragments derived from F2 and P6. These peptides may be used in a vaccine against Hib infection and antibodies against these peptides may be used in test kits to detect H. influencae in a sample. The vaccine may further comprise a immunosenic or inked to synthetic PRP as synthetic lipoglycopeptide conjugates to produce alternative vaccines.

Claim 1; Page 8; 15pp; English.

Peptide may be used as a vaccine to the disease caused by H1 type b, as carrier for conjugation to oligosaccharide derived from Haemophilus. Protein may be used with other haptens as T-cell dependant antigen and carrier.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               R07043:

oligo (084348) was designed to be 40 bp 5' of the ATG start codon. The 3' oligo (08449) was designed to be 300 bp 3' of the stop codon. Both oligos contd. Sall restriction sites. The amplified DNA was used to transform E.coli and the resulting colonies isolated an analysed. Clones contg. a 1.4 kb fragment were chosen for DNA sequence analysis. One clone, designated pNv-1, was found to be identical to the published sequence for Hib strain Minn A (Munson, R. and Tolan, R.W. Infection & Immunity 57:88-94, Jan. 1989). The synthetic oligos used to sequence the DNA are indicated in the FT. The direction of sequencing was 5'-3'. The rest of pNv-1 is identical to pUCI8. The lac promotor is adjacent to the lower
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

Claim 1, Page 8; 15pp; English.

Peptide may be used as a vaccine to the disease caused by H1 type b, as carrier for conjugation to oligosaccharide derived from Haemophilus. Protein may be used with other haptens as T-cell dependant antigen and carrier.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

Production of Haemphilus influenzae HibP2 protein - for the prevention of bacterial meningitis in animals.

Production of Haemphilus influenzae HibP2 protein - for the prevention of bacterial meningitis in animals.

Production of Haemphilus influenzae HibP2 protein - for the prevention of bacterial meningitis in animals.

Production of Haemphilus influenzae type be (hib-P2) with 22 Aas of gene 10 of prevention of bacterial meningitis in animals.

Production of Haemphilus influenzae type be (hib-P2) with 22 Aas of gene 10 of phage T7 at the N-terminus that were derived from the pET-17b captesion vector (Novagen pET System Manual). To P2 into observed to print to phage T7 at the nature porint to be cloned into the BamHI site of peT-17b, thus yielding a fusion protein P2 to gene 10. The sequence of this oligo was Q84351. The extraneous 3' sequences were aliminated by introducing Ahol site about 10 protein to the Iranslation stop codon. This oligo (Q84352) contd. an Xhol site to allow it to be cloned into the Xhol site of pET-17b. PCR was used to generate a liminated by introducing Xhol site of peT-17b. PCR was used to generate a liminated by introducing Ahol site of per-17b. PCR was used to generate a liminated by introducing Ahol site of per-17b. PCR was used to generate a liminated by introducing Ahol site of per-17b. PCR was used to generate a liminated by introducing Ahol site of per-17b. PCR was used to generate a liminated by introducing Ahol site of per-17b. PCR was used to generate a liminated by introducing Ahol site of per-17b. PCR was used to generate a liminate Animated Ahol site and the 3' ollgo contg. the BamHI site and the 3' ollgo contg. the Ahol site and the 3' ollgo contg. the Ahol site of per-17b. PCR was used to generate a limit to the BamHI site and will site and will site and will site and will site and wil

                                                                                                                                                                                                                                                                                                                                                                         22-AUG-1995 (first entry)
WYV-2 fusion construct of H. influenzae P2 with T7 gene 10 protein. Haemophilus influenzae type b; outer membrane protein; P2; pNV-2; fusion protein; fusion P-2; gene 10; major capsid protein; T7.
             used for producing immunogenic compsns. as vaccines and in diagnostic hybridisation assays.
Disclosure: fig 6: 20pp; English.
P2 antigen of Haemophilus influenzae (see corresp. N90033).
Isolated from type b strains, the P2 antigens are used as vaccines and to detect P2-specific RNA or DNA. Segments used as antigens and to detect p2-specific RNA or DNA. Segments used or antigens or their functional equivalents.
Sequence 362 AA;

New recombinant DNA for producing fusion proteins - comprising microbial pathogen epitope inserted into Haemophilus influenzae P2 microbial pathogen epitope inserted into Haemophilus influenzae P2 protein loop 5, used in vaccine memorane in Page 40-43; 54pp. English.

Example 1: Page 40-43; 54pp. English.

The loop 5 portion of Haemophilus influenzae strain 1479 outer common protein P2 (W131678) provides a structure suitable for fusion with, and display of, one or more heterologous or homologous peptide sequences. A method is provided for producing a fusion protein comprising a P2 protein in which loop 5, or a portion of it, displays a heterologous or homologous peptide sequence which antigenically minics an epitope from a microbial pathogen. The cantigenically minics an epitope from a microbial pathogen. The exposed sequence) and used as an immunoapen against disease caused by H. Influenzae and/or the microbial pathogen. It is esp. used to treat infection by respiratory pathogens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   One-step conversion of cephalosporin C into 7-amino:cephalosporanic acid - allows environmentally friendly production of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                             A cephalosporin anidohydrolase (R97616) was identified as the product of the gac gene (T29215) of Pseudomonas vesicularis strain B965. The enzyme is capable of converting cephalosporin C and its derivatives to 7-aminocephalosporanic acid and its derivatives, building blocks of semisynthetic cephalosporin antibiotics. The method is cheap, involves simple technology and is environmentally safe. The enzyme is obtd. by incorporation of the gac gene into a vector and expression in e.g. Escherichia coli.                                                                                                                                                                                                               Serratia marcescens mutant M-1 - with high esterase productivity Example 3; Pages 10-13; 15pp; English.

The present sequence represents an esterase of Serratia marcescens. A S.marcescens mutant was produced and designated M-1 (FERM BP-4068). The M-1 mutant is obtained by treating S. marcescens Sr41 (FERM BP-467) with N-methyl-N'-nitro-N-nitrosoguandine. The M-1 mutant has a two fold higher productivity of esterase than the wild type organism. The mutant is used for producing M-1 esterase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                N-FSEBS 17,0437, 042858.

New genes encoding esterase from Serratia - are contained in recombinant vectors and transformed cells with high esterase productivity, useful as hydrolytic reagent

Disclosure; Page 11-13; 16pp; English.

N-Methyl-N'-nitro-Noultrosoguandine and mutants selected on tributyrin medium, the mutant MI was identified. MI contains an allelic variant of C -> T at position 9. MI has 2.5 times greater esterase prod. than Sr41. The esterase is useful for carrying out hydrolytic reactions.

Mean 24.385; Variance 32,736; scale 0.745 Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

#title The hbpA gene of Haemophilus influenzae type b encodes a
heme-binding lipoprotein conserved among heme-dependent
Haemophilus species.

*superfamily Cellulomonas cellulose 1,4-beta-cellobiosidase A: bacterial cellulose-binding domain homology; Streptomyces endo-1,4-beta-xylanase A homology extracellular protein; glycoprotein; glycosidase; hydrolase; polysaccharide degradation; tandem repeat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
the amino-terminal sequence of the mature protein (residues 42-71) has been determined (M.L. Langsford, unpublished data)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Waring, G.L.; Hawley, R.J.; Schoenfeld, T.
Dev. Biol. (1990) 142:1-12
Multiple proteins are produced from the dec-1 eggshell gene
in Drosophila by alternative RNA splicing and proteolytic
cleavage events.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             #domain Streptomyces endo-1,4-beta-xylanase A homology #1abel SXY, #1abel SXY # region 7-residue repeats (P-T-P-T-[S/T])\ #domain bacterial cellulose-binding domain homology

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 24.996; Variance 29.785; scale 0.839

-!- FUNCTION: PERMEASE THAT IS INVOLVED IN THE TRANSPORT ACROSS THE CYTOPLASMIC MEMBRANE OF LYSINE.
-!- SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN. INNER MEMBRANE.
-!- INDUCTION: HIGH, IN ANAEROBIC MEDIA OF LOW PH, CONTAINING LYSINE.
-!- SIMILARITY: BELONGS TO THE AMINO ACID PERMEASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ELLIS J., CARLIN A., STEFFES C., WU J., LIU J., ROSEN B.P.; "Topological analysis of the lysine-specific permease of Escherichia

Mean 22.786; Variance 86.998; scale 0.262 Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

26 Coding for TCS in a T.kirilowii genomic library. Five clones were contently isolated and sequenced, including clone 3.
27 Phey were found to have homology to the alpha-TCS coding sequence.
27 See also Q06343-9 and Q06351.

The riboflavin genes isolated from S. cerevisiae allow the prodn. of riboflavin in eukaryotes. The gene products are: rib-1 gene: quanosine triphosphate (GTP)-cyclohydrolase II (transforming GTP to 2,5-diamino-4-7. pyrimidine-5-phosphate);

- rib-7 gene: #TP-reductase (transforming 2,5-diamino-6-ribosylamino-4-7. phosphate into 2,5-diamino-ribitylamino-3,4-(14,3H)-pyrimidine-5-phosphate (DRAP));

- rib-2 gene: (DRAP)-deaminase (formation of 5-amino-6-ribityl
                                                                                                                                                                                                                                                   Nucleic acid encoding trichosanthin protein - which can be used inactivate ribosome(s) to inhibit protein synthesis or to inhibit HIV expression

Example 7: Fig 19: 53pp; English.

The clone pQ30E, containing a 0.6kb insert, which was isolated from a T.kirilowin library (see Q26501), was used as a probe to isolate additional sequences homologous to alpha-TCS, i.e. other members of the RIP multi-gene family. Four unique cloned inserts were identified and designated pQ2, pQ3, pQ12 and pQ24. Each insert see Q26499-Q26508.

New DNA encoding enzyme for fragmenting N-acetyl:heparosan -
related protein, vector, transformed cells, etc.

Claim 2; Page 38-40; 54pp; French.

An enzyme which degrades high mol.wt. N-acetylheparosan into
fragments of lower mol.wt. (More suitable for use as pharmaceutical
staring materials) can be obtained from E.coli (K5) SEBR 3282. The
DNA sequence (086268) coding for the enzyme was isolated in a
CC plasmid (p838.7) which has been deposited in E.coli RRI strain as
CNCM I-1352. The deduced amino acid sequence (R71802) has homology
Sequence 820 AA;

The present sequence represents a Mycobacterium tuberculosis protein. Products from the present invention, which describes protein fragments and nucleic acid fragments derived from M. tuberculosis, can be used in the detection of and prevention of mycobacterial infections. In particular, the proteins and nucleic acids can be used for the diagnosis of or vaccination against tuberculosis caused by M. tuberculosis, M. africanum or M. bovis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Host cell expressing surface layer protein fusion protein - used for host presentation of antigens and vaccine prodn.

Disclosure: Fig. 6: 95pp; English.

A probe based on the N-terminal sequence of B. sphaericus P-1 (LMG P-13655) surface layer protein was used to screen an HindIII-generated library to isolate the slp gene. Promoter regions of the gene are used in genetic constructs providing surface expression of heterologous proteins in P-1 hosts.
                                                             New isolated mycobacteria polypeptides and nucleic acids - used developing products for the diagnosis of or vaccination against mycobacterial infections, particularly tuberculosis Claim 1: Page 223; 163pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Surface layer protein; SLP; fusion protein; vaccine; antigen; surface expression; epitope.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     W41513 standard; Protein; 371 AA.

This sequence represents a Staphylococcus aureus protein, that based on homology with an Escherichia coll protein, is a nickel-binding periplasmic protein precursor, and is encoded by a DNA sequence of the invention. The DNA sequences were isolated from Staphylococcus aureus WCHU29 (NCIMB 40771). Host cells containing the DNA sequences are used to produce polypeptides or fragments. The proteins are used in the treatment of disease, for inducing an immune response by administering them, to produce antibody and/or T-cell immune response. Antagonists of the proteins are used for the inhibition of bacterial polypeptides.

Conditions which may be treated include bacterial infections, especially respiratory, cardiac, gastrointestinal, central nervous, eye, kidney, crimary tract, skin, bones and joints. The proteins can also be used to identify antimicrobial compounds which are broad spectrum antibiotics, especially useful in the treatment of H. Pylori infection.
                                                      30-0CT-1998 (first entry)
Nickel-binding periplasmic protein precursor.
Stabhylococcus aureus protein; immune response induction; eye infection; antibody production; T-cell immune response; gastrointestinal infection; respiratory infection; inhibitor; bacterial infection; central nervous system; kidney infection; urinary tract infection; antimicrobial compound identification; broad spectrum antibiotic;

The sequences given in W21698-710 represent Ribosome Inactivating Proteins (RIP's), which may be used in the construction of the proteins (RIP's), which may be used in the construction of the internal peptide linker. The proRIP has a selectively removable internal peptide linker. The proRIP has a selectively removal of inactivating eukaryotic ribosomes, but can be converted by removal of the linker into a protein having alpha and beta fragments and being capable of inactivating eukaryotic ribosomes. RIPS are potent inhibitors of eukaryotic protein synthesis. They possess a highly specific N-glycosidase activity which cleaves the glycosidic bond of adenine 4324 of rat liver ribosomal 268 RNA. RIP's selectively inhibit cellular proliferation of cells, e.g. cancer cells and HIV-infected T cells. The inactive proRIP proteins make it possible to provide protein possible make the previous provide protein prossible make the machime provide protein prossible make the machime provide protein prossible make the provide protein prossible make the machime make the provide protein prossible make the provide protein processible make the processible to provide protein processible make the processible make the

This sequence represents an alpha-2,3-sialyltransferase which has been isolated from Neisseria meningitidis. The protein can be used as a reagent for adding a sialic acid residue to an acceptor having a terminal galactose residue, e.g. in synthesis of biologically active oligosaccharides or sialyl "modified proteins or lipids. The nucleic acid sequence can be used for the recombinant production of
                                                                                                       N-PSDB; V04125.
Nucleic acid sequence encoding Neisseria
alpha-2,3-sialy1:transferase - useful to add sialic acid to acceptor
with terminal galactose residue for synthesis of biologically active
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     pro-Ribosome Inactivating Protein; proRIP; peptide linker; cancer; inactivation; eukaryotic ribosome; alpha fragment; beta fragment; inhibitor; protein synthesis; N 91ycosidase; glycosidic bond; liver; rat; ribosomal 288 RNA; cellular proliferation; HIV-infected T cell;

17 The Invention covers analogues of the invention have a cysteine and the analogues of the invention have a cystein carresp. to a position not naturally available for bonding; the cys residue is located in the C-terminal region of the analogue between a position corresp. to amino acid 251 and the C-terminus of cricin A chain. The analogues are pref. Joined via a distubhide cell, e.g. inkage to a molecule which specifically binds to a target cell, e.g.

Polynucleotide(s) encoding gelonin analogues - having a cystein residue for intermolecular bonding for the prodn. of immuno-toxins(s) by Sciosure; Figure 4; 66pp; English.

Pacciosure; Figure 4; 66pp; English.

Analogues of Type I RIP are defined as non-naturally occurring polypeptides that share the ribosome-inactivating activity of the natural protein but differ in AA sequence. Preferred analogues have a cys available for disulfide bonding located at a posn. it its AA sequence from the posn. corresp. to posn. 251 in ricin A-chain RTA to the carboxy terminus of the analogue. (R74176 is the sequence of ricin A-chain RTA, which is a Type I RIPP). The primary AA to the carboxy terminus of the analogue. (R74176 is the sequence of ricin A-chain RTA, which is a Type I RIPP). The primary AA sequence of the Type I RIPS gelonio, BRIP, mormordin II, luffin (see Islam et al. Agricultural Biological Chem., 54(5) 1343-45 1991], alphatrichosanthin (see Ho et al., 31. 1810. Chem., 54(5) 1343-45 1991], alphatrichosanthin (see Ho et al., BAL). Chem., 265, 8670-74 (1990), momordin I (see Ho et al., BAL). Chem., 264(12) 6629-37 1989), poskewed antiviral protein isolated from 2 seeds (see Kung et al., Agric. 3. Biochem., 183, 465-70 (1989) are individually aligned with the primary sequence of the ricin A-chain (see Halling et al., Nucleic Acids Res., 13, 6 and caporin (see Halling et al., Nucleic Acids Res., 13, 6 and caporin et al., Achain and the Type I RIPS are indicated in FT.

Wew protein of Luffa cylindrica, extracted form seeds - is used for inhibiting protein synthesis in viral proliferation.
Claim 1, Ffg 1, 6pp; Japanese.
The protein is prepd. by extraction from seeds of L. cylindrica.
It has protein synthesis inhibiting activity and is useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

DNA encoding pro-ribosome inactivating proteins - inactive precursors of ribosome inactivating proteins; can be expressed in evaryotic cells without causing cell death claim 4: Column 117-120; 186pp; English. W25141 shows a Luffin-A (ribosome inhibitory protein, RIP) protein which was engineered to contain a selectively removable internal peptide linker sequence separating the alpha and beta units of the RIP. When separated the two units regain activity and are capable of inactivating eukaryotic ribosomes and hence preventing protein production. Many different RIPs may be produced with an internal linker including
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 W25141;

Signature of the first state of the first state of the first state of the nine RIPs described in R63903-R63911.
C RIPs are key components of cytocoxic therapeutic agents (CTAs), which include gene fusion products and immunoconjugates. CTAs may be used to selectively eliminate any cell type to which a RIP component is targetted, by the specific binding capacity of the component of the agent. They can be used in the treatment of diseases where the elimination of a particular cell type is desired, such as autoimmune disease, cancer and graft-versus-host
